ANUPAMDAGAR

I am an opensource contributor and have contributed to Zulip, Hasura, Fossasta, Publiciab and many other projects. My tech stack includes Python and Javascript. Python for server side and scripting and Javascript for the frontend. I use Django framework for the server side development and React for the frontend development. I have also worked with GraphQL, I am a QitHub Campus Expert at my institute where I am responsible for building on campus community. I am the lead organiser of Hack in The North Hackarbon and the cofounder of Pragma Conference field at IEIT Allahabad.

How to use github template. Template personal brand statement examples. Personal website template github. How to make a personal website examples using html. Github personal website examples. React personal website template github. Academic personal website template github.

Since I sold my soul to Google anyway, I recommend the Google Analytics configuration where you can enter the address of your site and receive a personal analysis ID. And, of course, ideally I'd like it to be free. At all of this, I was so dead in using Github's pages that I ignored anyway, I recommend the Google Analytics configuration where you can enter the address of your site and receive a personal analysis ID. And, of course, ideally I'd like it to be free. At all of this, I was so dead in using Github's pages that I ignored anyway, I recommend the Google Analytics configuration where you can enter the address of your site and receive a personal analysis ID. seemed to have decent revisions, with a lot of pleasant themes, should still be hosted on Github's pages, right? Make the login, go to manage your newly obtained domain and switch to the advanced DNS tab. What are we doing? Some of the central ideas should still work, such as registering a domain and hosting the Netlify site, but do not expect the details to be updated. And as an extra ba'nus, because I am a statistic nerd, it would be nice to have some use analysis to see where all five visitors are. (and failed) Of course, it's a little cry, but I think some motivation is not always bad my first thought was using github pages - it's techy, Af, I know a bunch of people with personal pages there, why not? The page is instantly live under that ugly URL, so can it be worth giving a shot? The configuration was, the principle, very frustrating, so if you are also thinking of riding your own piece of internet to write posts like this, I hope this helps you to avoid most of the problems. I chose the academic theme, which seems to be a whole beast in itself. Are not there? Spoiler alert: I got all this. Then when you push it to the server (or even in the localhost), you must access with a URL as . Alternatively, you can just go to the Settings tab and choose domain management. Finally, from time to time I like to make small programs of programming. Whether It is a student, be sure to sign up for the Github's education package to get that sweet sweet domain. If you are a statistical statistics Like me, you'll want some kind of analotics. Another thing is that apparently, notoriety is useful in the research - and for this purpose, while I could probably just start a twitter storm (as a side note: I am the Lecun team here), but a All much more productive will probably just write about my research (I intend to do - as soon as I get). After all, if you're doing a portfolio site, you want it to be beautiful, and I'd rather eat my thesis than to make a great project with CSS. (For reference - Now I am using the script ./view.sh, you get an instance from your site in Running locally on your machine, at localhost: 1313 where you can instantly see any changes made. If you want to do some development in your local machine (recommended, but not obligatory), go ahead and install Hugo according to QuickStart. Git Commit -M "" Git Push Origin Mast and in one minute or more, your real site must be updated automatically. As mentioned before, we will be using Hugo, which is a static site generator built on going, but they do not worry - I needed to write or read a single line of going, and neither do you. Configuration to summarize what we are going to build - a Blog of Hugo using the academic theme, hosted on the Netlify of a Github repository, available through a free Namecheap domain. Once you have your education package, check out the offers. You can see this for yourself - just go to the page to start Hugo Academic and just follow your instructions - click on the beautiful button shown below and create a Netlify account. And if you are a google recruiter, please hire me :) however, I would like to give you an idea of what I did I did, and maybe a Interesting narrative to read. While you can do theoretically all the changes in your browser, I recommend cloning the repository to your computer and using a SANE text editor for this. So, how difficult it is to get a domain anyway? If you go to the Netlify admin panel, you some dollars to help avoid some potential sobs on the way. Google Analytics maybe? But if you have, you must have a live website under a good domain .me, with an idea of how to customize it to your liking, and this is not that a whole person needs happiness? Well, almost. Then, he goes to Hugo Quickstart's page and if you are something like me and want to get at least a feeling of what happens, go through the tutorial to understand what is and how it works. So, with all the probability, you are good to go. I'm assuming you know the drill now "Read the documentation, look for what you want to know on Google and customize your site to your heart's delight. Of course, with some more effort, you Also you can use other static site generators. So, from Hugo Tutorials and Quickstarts, movi quickly for Hugo's academic documentation, which made the site version of the site look very cool -Go, but for some reason, GitHub's pages have just returned a compilion error, apparently resulting from some not used file in the wage theme. SUP Dawg, I heard you as sites on your sites like I'm about to get a PhD, I looked back at my age - ambitious, hopeful, looking at everyone at my university that works with similar things to get some research experience. The thing is, I'm stingy and I do not want to pay. Go ahead and remove all records and create a new one. So I went to the hole rabbit make my own fork of the academic theme with the necessary change to remove the subjective relationship from one a All this failing at the end. What did I try? See, there's this thing called Github Education, where you can get free access to a lot of free software - do not stop taking a look! One of the offers is a free domain. In Namecheap for a year. Maybe it's useful for someone who, like a few months, was eagerly preparing to set up a website, but did not know anything about it. There are a lot of them, and what called my eye was Hugo. This has proven to be surprisingly simple - simply add a directory with the name corresponding to the path under which you want. How much did I know? On the one hand, there is the domain guide in your administration panel, where you can buy a domain directly through Netlify, which I'm sure I should be completely seamless and go to Namecheap. You can go to your beautiful domain and ... wait, what? So you just need to add it to config / default / params.toml under google_analytics, and that's it! Finally, I mentioned being able to host only any arbitrary HTML, regardless of all the shenanigans templates happening in Hugo. Here, you usually have several virtual options. Of course, it worked on my host, but after pushing the changes in Github was still broken. Most notably, missing severely in any kind of graphic design skills, which messes things a little. Wrong. And what I can say - still worked very well, I could adjust the site and have the new live version within a minute to push it to Github. You can then choose a domain and, as long as it is still available, get it completely for free for a full year! Now only Connect the parts. Because really, it's not as scary when you find what works for you. ME ME I'm sure it's possible, it's probably not so hard, if you know what you're doing, but it just did not happen in my case. Fortunately, I am a student - and here where Github's education comes. So, to summarize, what I wanted was a nice blog platform that deals with more boring things for me, allows some convenient functionality to display my projects, and any ability to host only a few HTML files under a path URL to do what I get. Anyway, I hope you enjoyed this brief journey by the process of making this site exact. Once again, you want it to be a record, with @ as the host (do not ask me what that means, though), and the value set to the IP that you copied earlier. Add, confirm that you are the owner and you will probably see any warning or error message - NAfA £ The worry! Just investigate, and you should see some scribbles about a record A and some IP address. If you come away, it is likely that you have actually followed the tutorial - vet. In advanced DNS, in host records. there will be some records. And one thing I immensely appreciated was when research and guests visitors to contact them. Full Disclosure - I'm not a web developer, I only have a vague idea of how it works, but how it works, I have no reason to complain. Correct. When creating the Netlify website, you had to choose a repository name for Github - which is where the source code of your site resides. Head for and pass through the process you need to get the package. I am very comfortable with Python and to a lesser degree, other languages (of which the most relevant is probably JS, or preferably TS), and we know enough DEV to write a simple server and a simple front end. This is This in the Department of Dev. Very easy, as it happens, at least if you are a student. The changes of DNS like this can take 24-48h to propagate, so just skip this amount of time forward and voil, your beautiful domain! Customization Now let's put something on the site! As there is no way I predict what you want, I will not copy all the academic documentation, because I can only bind it. So, if it sounds like something you want, keep reading. Just some visualization, maybe a game or an animation on the HTML screen, and be nice to host it on the internet somehow, under my own domain without having to set up an entire backend for this, if worry about security and all this. And if you are well with only production tests, modifying files directly in the github ... I mean, I will not stop you, you can skip the entire paragraph and move on to the implementation That you may have noticed that we really do not set the site. But even if git sounds intimidating - trust me, do not just make sure you have installed (Mac / Linux) or install it (Windows), enter the commands in the article and tutorials linked, and you will be Good to go. This is because the academic theme and Netlify are coupled together so well that really happens automatically. If you want to go to the technique thing - just go to the set of configuration, since I know how frustrating it is to read the entire autobiography of the author before they reach the point. Fortunately, all you need to know for this process is how to use git (at least the basic) and how to edit text documents. But you can easily jump this so well - you can just look at things like you go in the future. The final component is the trip in time. While you're here, feel free to check the rest of my site, I'm really very happy with the way it's over. If you are not a student - well, you probably will have to leave a Bucks for domain, but contrary case, the process should be the same. Then, when you are satisfied with the result, you can push the changes in GitHub with the following commands: GIT ADD. Somewhere, while this, Hugo Academic seems to have suffered great changes, including a rebranding to Wowchemy, so this guide will probably be less than useful at this time. As mentioned earlier, by pattern, you get a domain name such as ecstatic-volhard-8cf203.netlify.app that simply does not look memorable. And in fact, this is. Anyway, you will be presented with a personalized domain window that should request a domain. First things first, if you do not have one, get a free Github account. As you can see, there are many of them - do not forget to see if there is something else you like! But now just find the namecheap offer and, for your suggestion, connect your GitHub account to the namecheap. You see, Hugo Academic has a quick click for Netlify. To be said "Go to your administration panel and check to ensure that it works, even under this ugly address, since we are now about to repair this. Sorry for this! Back to the programming Usual ... so, as you may have noticed, this is a new site. The thing is, when I set it (grace), it worked like a dream. It's not a CSS To give you an idea of my technical ability, at the time of writing, I just finished a master's degree in autonomous systems and I'm preparing to start a PhD in artificial intelligence. Button and just like the "You have a live website! Of course, it's a bit dull and literally just a model preme, but hey "" after figuring out how to customize it and add some content, you'll have practically done, right? It may take a while to get all the credentials confirmed - if this is the case, just jump Seção for now and come back when approved. I was tempting - - A service that I am not particularly familiar with, and the default domain name that you receive for free is something like ecstatic-volhard-8cf203.netlify.app - yes, this will not work for my Hip research blog. I had really experienced with Jekyll for a year, but I do not like it very much - I found the customization to be a bit complicated, the creation of the domain was more complicated than I would like to be, and the Site just seemed ... boring. Boring.

Apr 12, 2021 · GitHub is a platform that offers software developers a place to host their code and manage their software products. Other than offering a place where you can save your code, GitHub Pages that allows you to host a website on their platform for free. GitHub Pages is a static site hosting service that takes HTML, CSS, and ... React Native Starter is a Mobile Application Template built with React Native that saves you hundreds of hours and tens of thousands of dollars in development costs. ... Purchase Personal Licence and get an access to the entire source code of the app with premium theme and all the screens and components. ... (access to GitHub repository): You ...
